Colophon

About the software that runs this site

2023-04-27

This site is built using a custom static site generator written in C#. Markdown conversion is handled by Markdig, YamlDotNet is used for YAML parsing, and templating is done using Handlebars.Net. PDFs are generated using Pandoc.

CLI

The CLI supports two commands: `build` and `serve`.

The `build` command builds the site.

```
$ builder build --root ./src --output ./dist
```

The `serve` command starts a local web server and automatically rebuilds the site when files change.

```
$ builder serve --root ./src --output ./dist --port 8080
```

Misc. Notes

An `install.sh` script is included in the root of the repository. This script AOT compiles the builder CLI and copies it to `~/.local/bin`.
